Common Operating System Questions on GeeksforGeeks

Below are some typical questions that appear frequently in OS interviews and exams, along with brief explanations.

1. What is a process? Explain different states of a process.

Answer: A process is an executing instance of a program. It is a dynamic entity that requires system resources such as CPU, memory, and I/O devices. The different states of a process include: - New: The process is being created. - Ready: The process is ready to run but waiting for CPU allocation. - Running: The process is currently executing. - Waiting/Blocked: The process is waiting for an event (e.g., I/O completion). - Terminated: The process has finished execution. Understanding process states helps in scheduling and managing multiple processes efficiently.

2. Explain the concept of process synchronization and its necessity.

Answer: Process synchronization ensures that multiple processes or threads can access shared resources without conflicts, maintaining data consistency. It is necessary when processes operate concurrently, and their actions need to be coordinated. Common synchronization methods include semaphores, mutexes, and monitors.

3. What is deadlock? Describe the necessary conditions for deadlock.

Answer: A deadlock is a situation where a set of processes are blocked because each process is waiting for a resource held by another, creating a cycle of dependencies. The

four necessary conditions for deadlock are: - Mutual Exclusion: Resources cannot be shared. - Hold and Wait: Processes hold resources while waiting for others. - No Preemption: Resources cannot be forcibly taken away. - Circular Wait: A cycle of processes exists, each waiting for a resource held by the next. Understanding deadlocks aids in designing systems to prevent or resolve them.

4. Describe different CPU scheduling algorithms.

Answer: Common CPU scheduling algorithms include: - First Come First Serve (FCFS): Processes are scheduled in the order of arrival. - Shortest Job Next (SJN): Process with the shortest burst time is scheduled next. - Round Robin (RR): Each process gets a fixed time quantum in cyclic order. - Priority Scheduling: Processes are scheduled based on priority levels. - Multilevel Queue Scheduling: Multiple queues with different scheduling algorithms. Each algorithm has its advantages and trade-offs concerning throughput, response time, and fairness.

5. What is virtual memory? How does it work?

Answer: Virtual memory is a memory management technique that allows processes to use more memory than physically available by using disk space as an extension of RAM. It works through paging or segmentation, where parts of processes are stored temporarily on disk and swapped in/out as needed. This enables efficient use of memory and process isolation.
