This phase helps in understanding the site-specific constraints and opportunities, influencing the choice of structure type and design parameters.

2. Hydraulic Analysis and Flow Modeling

Accurate hydraulic analysis predicts how water will behave within and around the structure.

- Flow Quantification: Determine maximum, minimum, and average flow rates.
- Hydraulic Modeling: Use empirical formulas (e.g., Manning's

equation), computational models (e.g., HEC-RAS), or physical models to simulate flow behavior. - Sediment Transport Analysis: Predict sediment deposition or erosion patterns that could affect structure stability. - Flood Frequency Analysis: Establish design flood levels based on statistical analysis of historical data. This analysis informs the sizing and positioning of structures, ensuring they can withstand hydraulic forces during various flow conditions.

3. Structural Design and Material Selection

Once the hydraulic parameters are established, the structural design phase begins. - Structural Type Selection: Choose appropriate structure types based on hydraulic needs and site conditions (e.g., gravity dam, arch dam, embankment dam). - Load Calculations: Compute hydrostatic, hydrodynamic, seismic, and other loads acting on the structure. - Material Selection: Opt for durable, cost-effective materials such as concrete, steel, or earth materials, considering environmental exposure. - Design of Structural Elements: Design components like piers, spillways, gates, and foundations using applicable codes and standards. In this stage, designers also consider ease of maintenance, durability, and constructability.
