Neuroanatomy and Neurophysiology

Question 1: Which artery is most commonly involved in a classic lateral medullary (Wallenberg) syndrome? Answer: The

posterior inferior cerebellar artery (PICA) is most commonly involved in Wallenberg syndrome. Explanation: Wallenberg syndrome results from ischemia in the lateral medulla, often due to occlusion of the PICA. This leads to symptoms such as vertigo, ipsilateral facial numbness, and contralateral limb numbness. Question 2: Which cranial nerves are primarily affected in an oculomotor nerve (cranial nerve III) palsy?

Answer: Cranial nerve III (oculomotor nerve) controls muscles responsible for most eye movements, eyelid elevation, and pupil constriction. Affected functions include: - Eye movement (up, down, inward) - Eyelid elevation (via levator palpebrae superioris) - Pupil constriction (via parasympathetic fibers) Common clinical features: - Ptosis (drooping eyelid) - "Down and out" eye position due to unopposed lateral rectus and superior oblique - Dilated pupil with poor constriction

Neurosurgical Procedures and Techniques

Question 3: What are the key considerations when performing a craniotomy for a supratentorial tumor? Answer: Key considerations include: - Preoperative imaging: MRI/CT to determine tumor location, size, and relation to critical structures. - Patient positioning: Optimal to provide access and reduce intracranial pressure. - Surgical approach: Choosing the least invasive route with maximal exposure. - Hemostasis: Managing bleeding risks, especially near major vessels. - Neurophysiological monitoring: Utilizing intraoperative neuro-monitoring for cranial nerves and motor pathways. - Postoperative care: Monitoring for edema,

hemorrhage, and neurological deficits. Question 4: Describe the steps involved in performing a posterior fossa craniotomy. Answer: Steps include: 1. Patient positioning: Prone or sitting position, with head fixation. 2. Skin incision: Typically a midline or paramedian incision over occipital bone. 3. Bone removal: Craniotomy of the occipital bone, sometimes extending into the foramen magnum. 4. Dural opening: Carefully incising the dura to expose the cerebellum and brainstem. 5. Lesion access and resection: Using microsurgical techniques to remove tumors or address hemorrhage. 6. Hemostasis and closure: Ensuring bleeding control, closing dura, replacing bone flap if applicable, and suturing soft tissue.

Neuro-oncology

Question 5: What are the typical MRI features of a meningioma? Answer: Features include: - Extra-axial mass with broad-based dural attachment - Homogeneous enhancement after contrast administration - Dural tail sign (thickening and enhancement of dura adjacent to the tumor) - Well-circumscribed and lobulated shape - Possible calcifications and hyperostosis of adjacent bone Question 6: What is the primary goal in the surgical management of glioblastoma multiforme (GBM)? Answer: The primary goal is maximal safe resection of the tumor to reduce mass effect and improve prognosis, followed by adjuvant therapies such as radiotherapy and chemotherapy. Note: Complete resection is challenging due to infiltrative nature; thus, preserving neurological function is paramount.

Trauma and Critical Care

Question 7: What are the signs of increased intracranial pressure (ICP)? Answer: Signs include: - Headache worse in the morning - Nausea and vomiting - Papilledema (optic disc swelling) - Altered mental status or decreased consciousness - Cushing's triad: hypertension, bradycardia, irregular respirations - Pupillary changes (dilated or sluggish response)

Question 8: Describe the management of an acute epidural hematoma. Answer: Management steps involve: 1. Immediate assessment: Airway, breathing, circulation (ABCs). 2.

Neurosurgical consultation: Urgent imaging (CT scan) showing biconvex hematoma. 3. Surgical intervention: Emergency craniotomy to evacuate hematoma and control bleeding. 4. Postoperative care: Monitoring ICP, preventing secondary brain injury, and supportive care.

Vascular Neurosurgery

Question 9: What are the common surgical options for treating a ruptured cerebral aneurysm? Answer: Options include: - Clipping: Placing a clip across the neck of the aneurysm to prevent rebleeding. - Endovascular coiling: Filling the aneurysm sac with coils via catheter to induce thrombosis. - Flow diversion devices: Using stent-like devices to divert blood flow away from the aneurysm (more common in unruptured aneurysms). Decision factors: - Aneurysm size and location - Patient's clinical status - Anatomy suitability for endovascular vs. surgical clipping

Tips for Effective Preparation

Using Practice Questions

- Regular practice: Schedule consistent sessions with diverse questions. - Review explanations: Understand why an answer is correct or incorrect. - Utilize multiple resources: Textbooks, online question banks, and peer discussions. - Simulate exam conditions: Practice timed questions to improve test-taking skills. - Identify weak areas: Focus subsequent study on topics where mistakes are frequent.
