Implementing Data Structures in Java as per Narasimha Karumanchi

Let's explore some of the fundamental data structures with Java implementations inspired by the book's approach.

Arrays

Arrays are the simplest data structure, fixed in size and storing elements of the same type. `int[] numbers = {1, 2, 3, 4, 5};`

Linked List

A singly linked list comprises nodes, each containing data and a reference to the next node. `class Node { int data; Node next; Node(int data) { this.data = data; this.next = null; } } class SinglyLinkedList { Node head; public void insert(int data) { Node newNode = new Node(data); if (head == null) { head = newNode; } else { Node temp = head; while (temp.next != null) { temp = temp.next; } temp.next = newNode; } }`

Stack

Stacks follow Last-In-First-Out (LIFO) principle. `import java.util.Stack; Stack stack = new Stack<>(); stack.push(10); stack.push(20); int top = stack.pop(); // 20`

Queue

Queues follow First-In-First-Out (FIFO) principle. `import java.util.LinkedList; import java.util.Queue; Queue queue = new LinkedList<>(); queue.offer(1); queue.offer(2); int front = queue.poll(); // 1`

Binary Search Tree (BST)

A BST maintains sorted data for efficient search, insert, and delete operations. `class Node { int key; Node left, right; public Node(int item) { key = item; left = right = null; } } class BinarySearchTree { Node root; public void insert(int key) { root = insertRec(root, key); } private Node insertRec(Node root, int key) { if (root == null) { root = new Node(key); return root; } if (key < root.key) root.left = insertRec(root.left, key); else if (key > root.key) root.right = insertRec(root.right, key); return root; } }`

Implementing Key Algorithms in Java as per Narasimha Karumanchi

Beyond data structures, the book emphasizes efficient algorithms vital for solving computational problems.

Sorting Algorithms

Merge Sort

Merge sort divides the array and sorts each half recursively. `public class MergeSort { public void mergeSort(int[] arr, int left, int right) { if (left < right) { int mid = (left + right) / 2; mergeSort(arr, left, mid); mergeSort(arr, mid + 1, right); merge(arr, left, mid, right); } } private void merge(int[] arr, int left, int mid, int right) { int n1 = mid - left + 1; int n2 = right - mid; int[] L = new int[n1]; int[] R = new int[n2]; System.arraycopy(arr, left, L, 0, n1); System.arraycopy(arr, mid + 1, R, 0, n2); int i=0, j=0, k=left; while (i < n1 && j < n2) { if (L[i] <= R[j]) { arr[k++] = L[i++]; } else { arr[k++] = R[j++]; } } while (i < n1) { arr[k++] = L[i++]; } while (j < n2) { arr[k++] = R[j++]; } }`

Binary Search

Efficiently finds an element in a sorted array. `public class BinarySearch { public int binarySearch(int[] arr, int target) { int left = 0, right = arr.length - 1; while (left <= right) { int mid = left + (right - left) / 2; if (arr[mid] == target) return mid; if (arr[mid] < target) left = mid + 1; else right = mid - 1; } return -1; // Not found } }`

Graph Algorithms

Breadth-First Search (BFS)

Uses a queue to traverse level-wise. `import java.util.*; class Graph { private int vertices; private LinkedList[] adj; public Graph(int v) { vertices = v; adj = new LinkedList[v]; for (int i=0; i<v; i++) { } } public void addEdge(int v, int w) { adj[v].add(w); } public void BFS(int startVertex) { boolean[] visited = new boolean[vertices]; Queue queue = new LinkedList<>(); visited[startVertex] = true; queue.offer(startVertex); while (!queue.isEmpty()) { int v = queue.poll(); System.out.print(v + " "); for (int neighbor : adj[v]) { if (!visited[neighbor]) { visited[neighbor] = true; queue.offer(neighbor); } } } }`
